

# Ultrasound of cervical length: why, when and how

Elizabeth Bonney

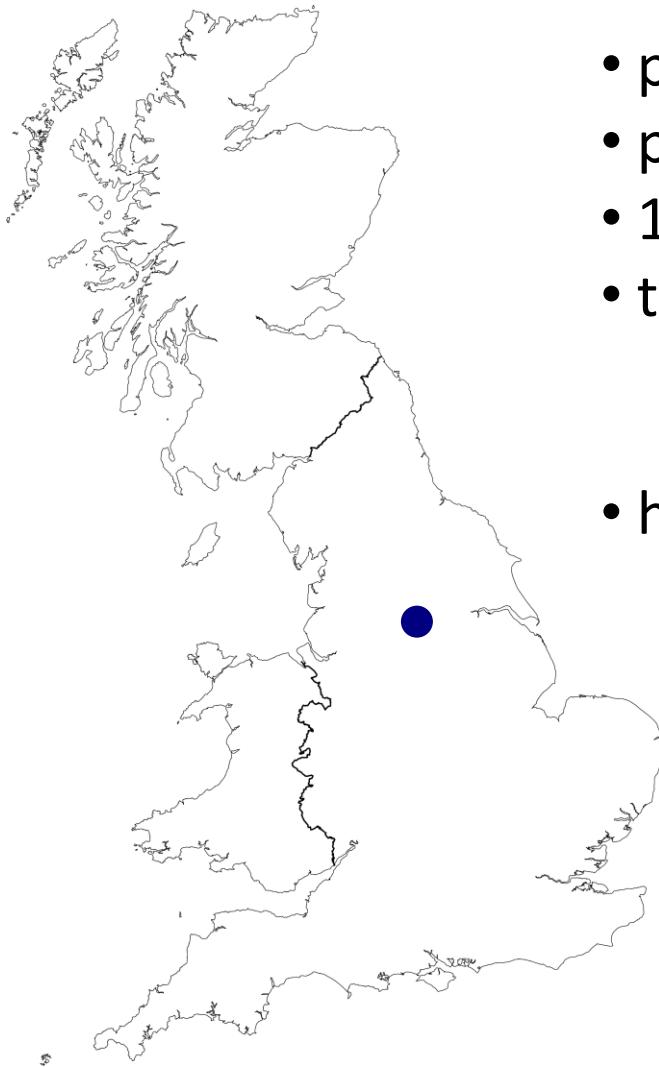

Consultant Obstetrician

Leeds Teaching Hospitals NHS Trust

[elizabeth.bonney@nhs.net](mailto:elizabeth.bonney@nhs.net)

# Leeds

---

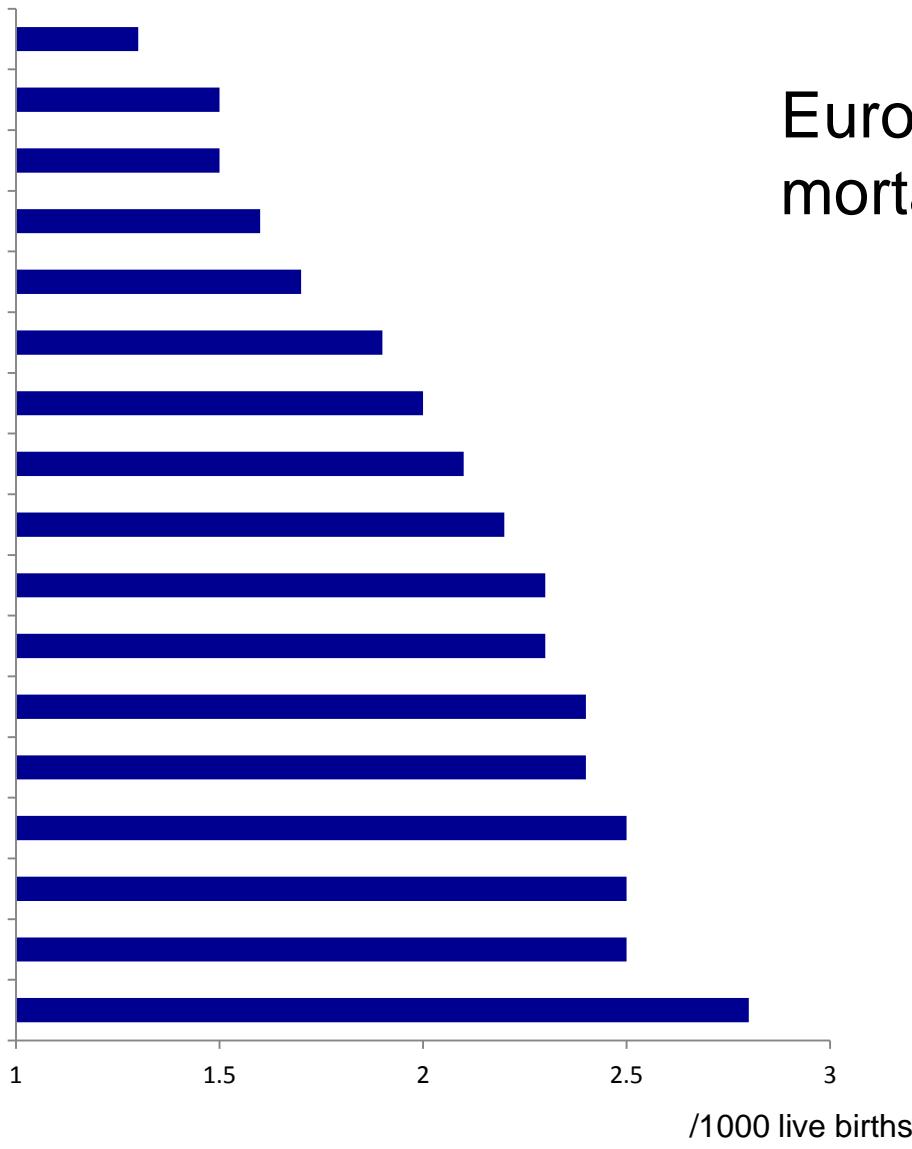

- population 750 000
- previously heavily industrialised
- 10000 deliveries/yr
- two maternity units
  - Leeds General Infirmary
  - St James's University Hospital
- higher than average deprivation

# Leeds

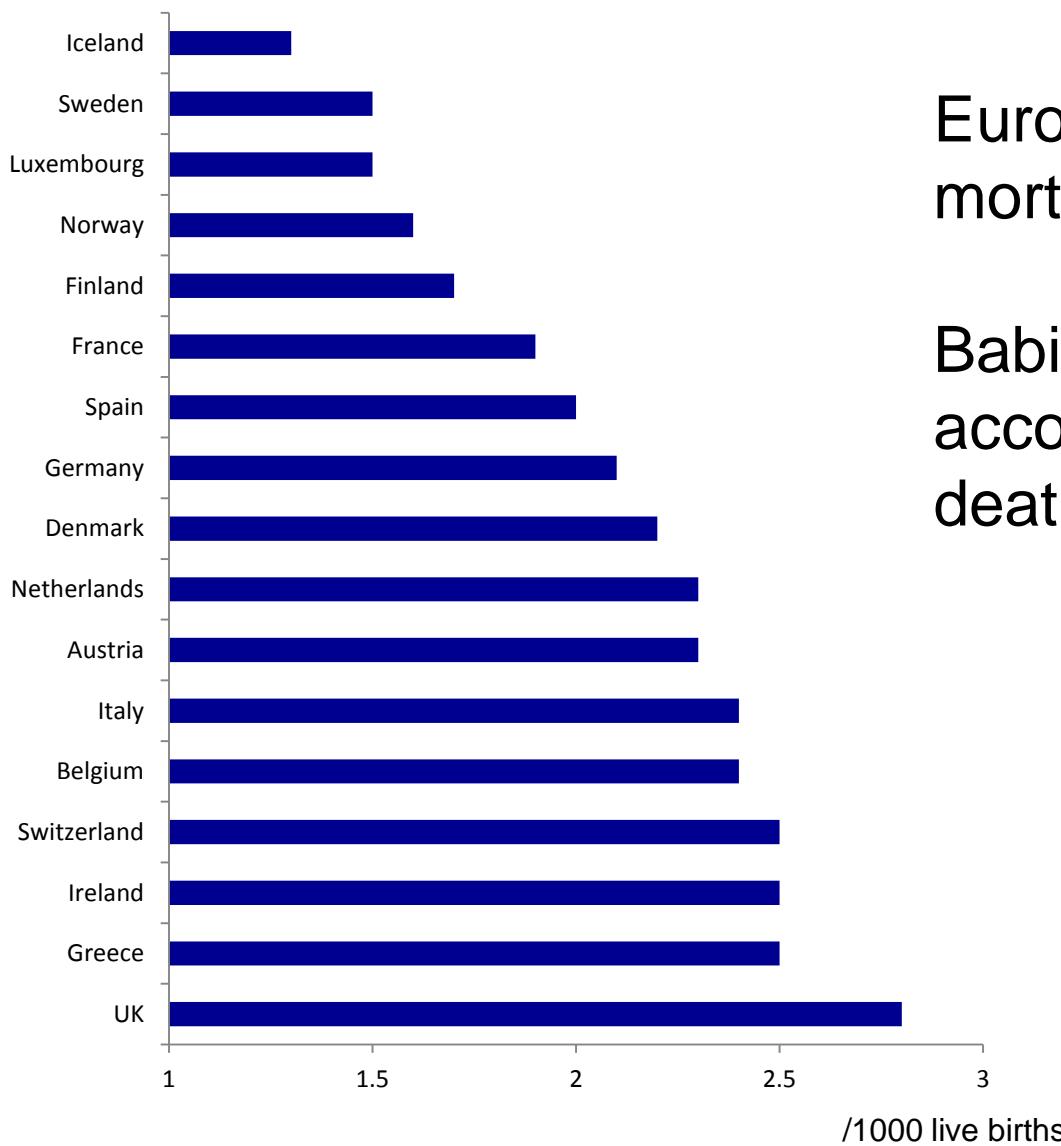

---

- history
  - preterm birth rate 11% in 1999
  - prevention strategy
  - clinic started following year
- progress
  - 2 clinics/week, 2 consultants
  - 500 referrals/yr (20% regional)
  - >100 individual clinic episodes/month

## European neonatal mortality rates 2013

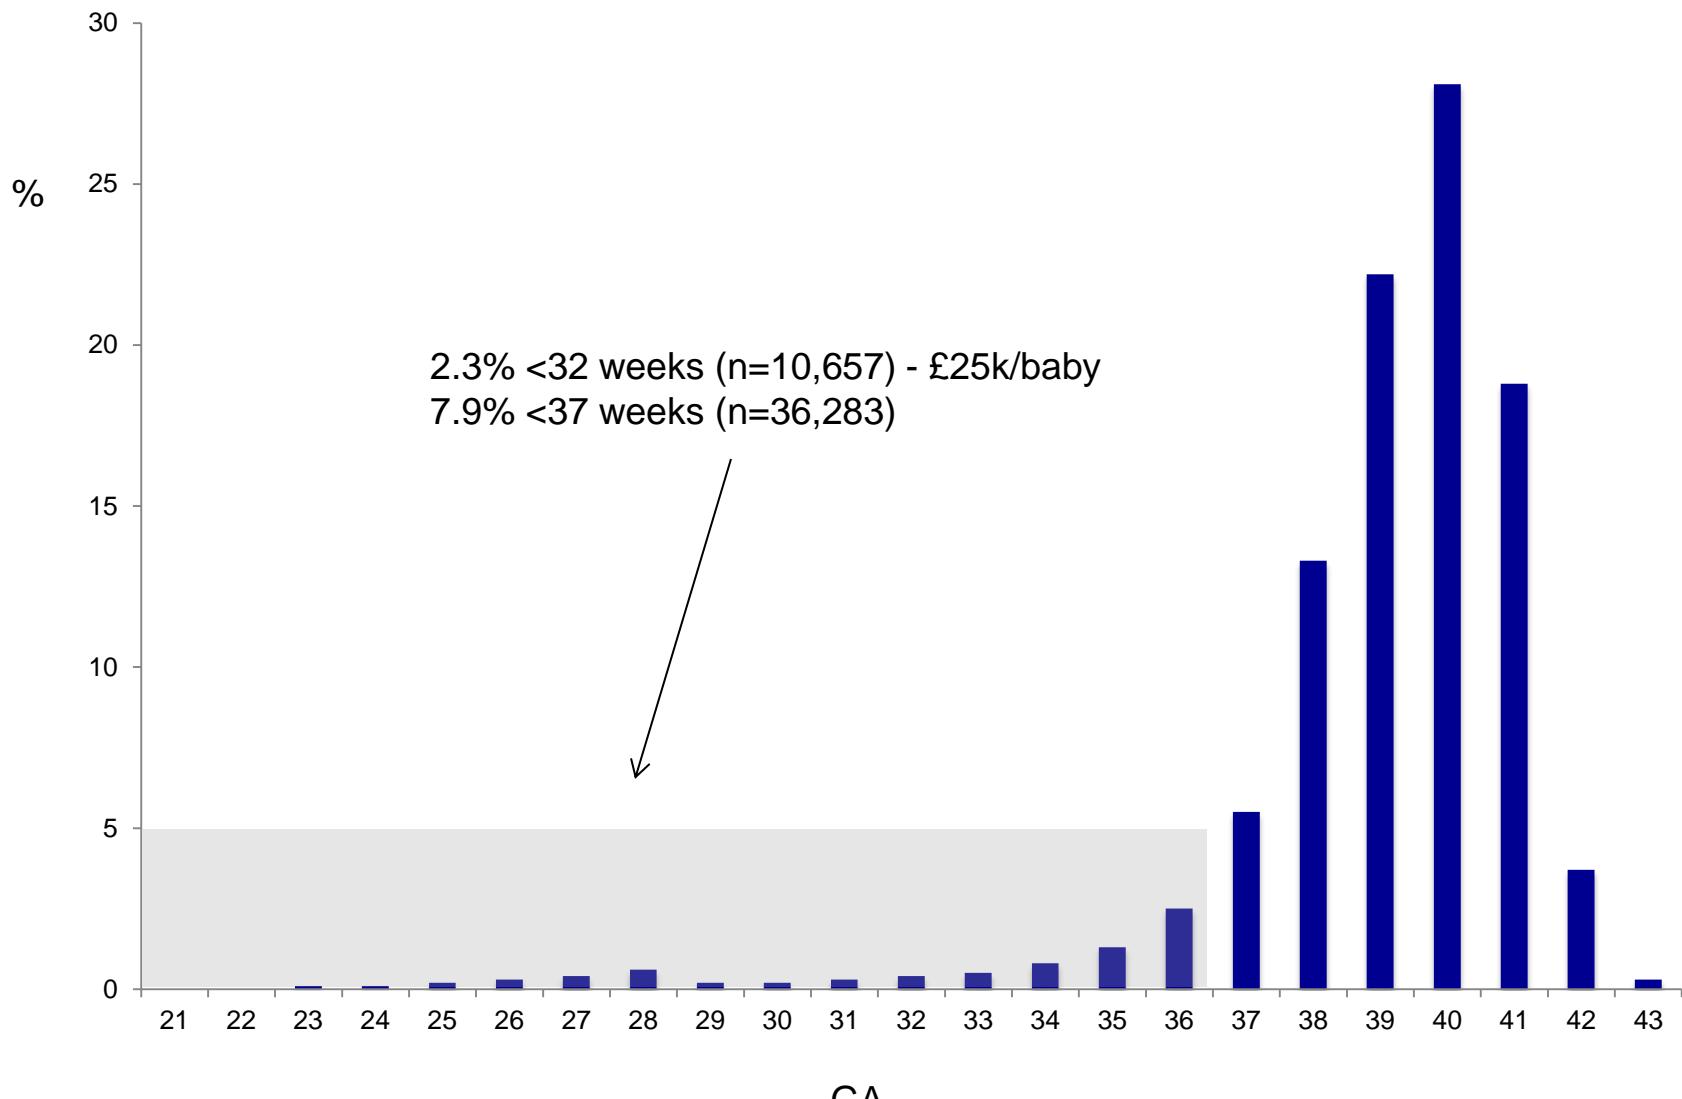

Wang et al Lancet (2014)

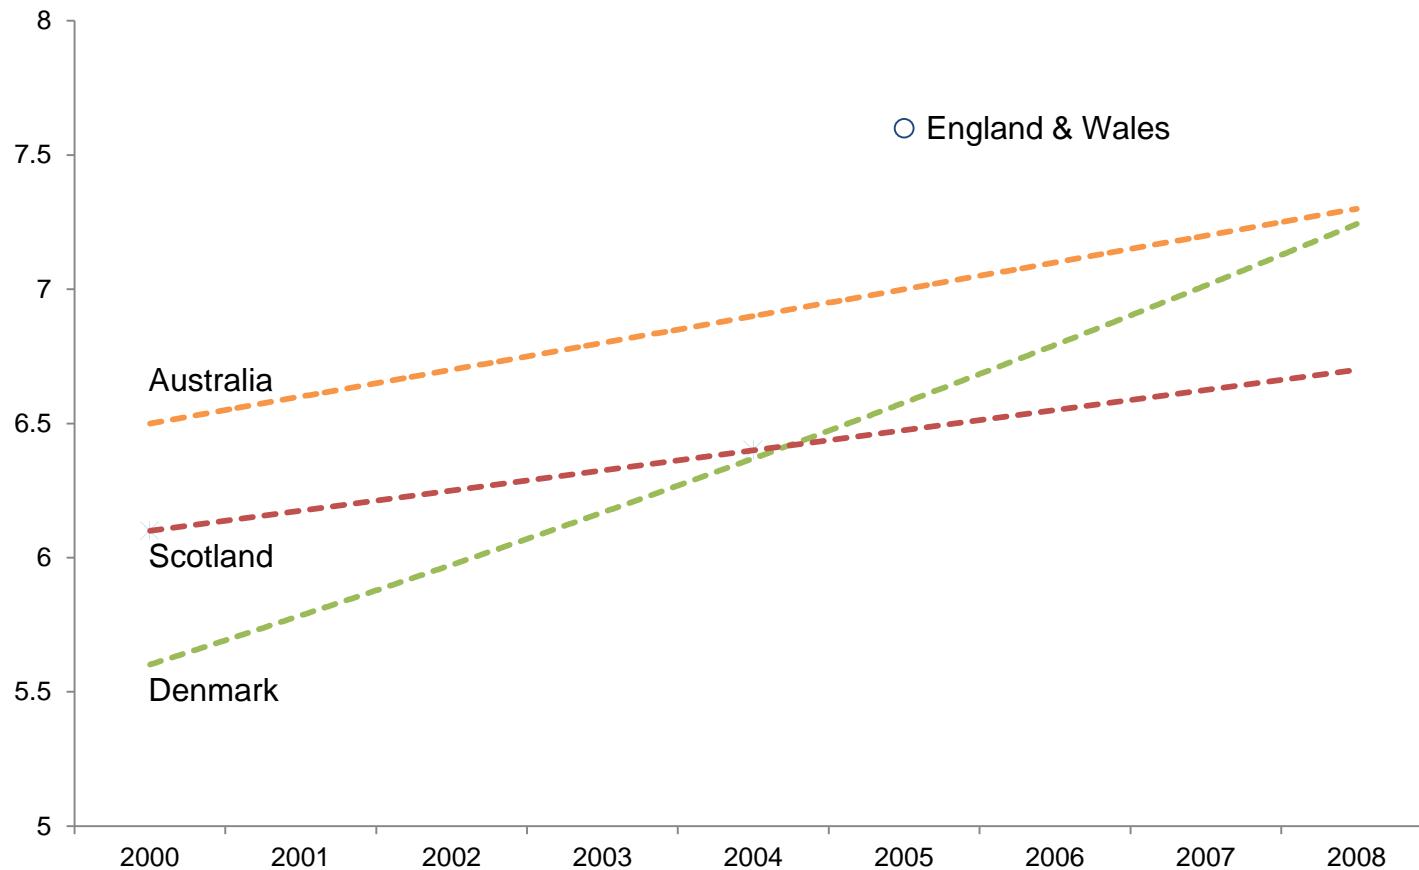

European neonatal  
mortality rates 2013

Babies less than 2500g  
account for 75% of  
deaths

Review: Repeat digital cervical assessment in pregnancy for identifying women at risk of preterm labour  
 Comparison: 1 Systematic digital cervical examination versus no examination unless medically indicated  
 Outcome: 1 Preterm birth < 37 weeks

No reduction in preterm birth...

Review: Repeat digital cervical assessment in pregnancy for identifying women at risk of preterm labour  
 Comparison: 1 Systematic digital cervical examination versus no examination unless medically indicated  
 Outcome: 7 Hospital admission before 37 weeks

...but increased likelihood of admission

# Cervical length

---

- technique

Study	'failed' images
Preterm Prediction Study (MFMU Network)	20%
SCAN Trial (MFMU Network)	15%
NuMOM2b Network	30%
CerviLenz Study	11.5%
PREGNANT Trial	10%

# Cervical length

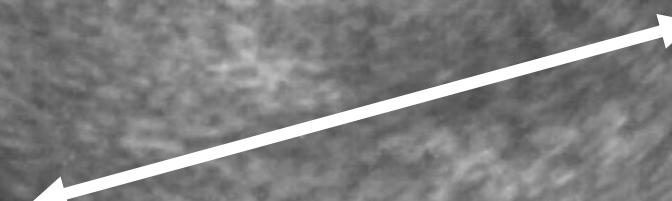

---

- technique
  - cervix occupies 75% of the image
  - anterior width = posterior width
  - maternal bladder empty
  - internal os seen
  - external os seen
  - cervical canal visible throughout
  - caliper placement correct

♦ 3.21cm  
× 1.35cm

# Cervical assessment

---

- implications of short cervix
- determine causation:
  - normal length for that woman?
  - previous excisional procedure?
  - structural weakness of internal os?
  - early parturition?
  - combination of any of these?

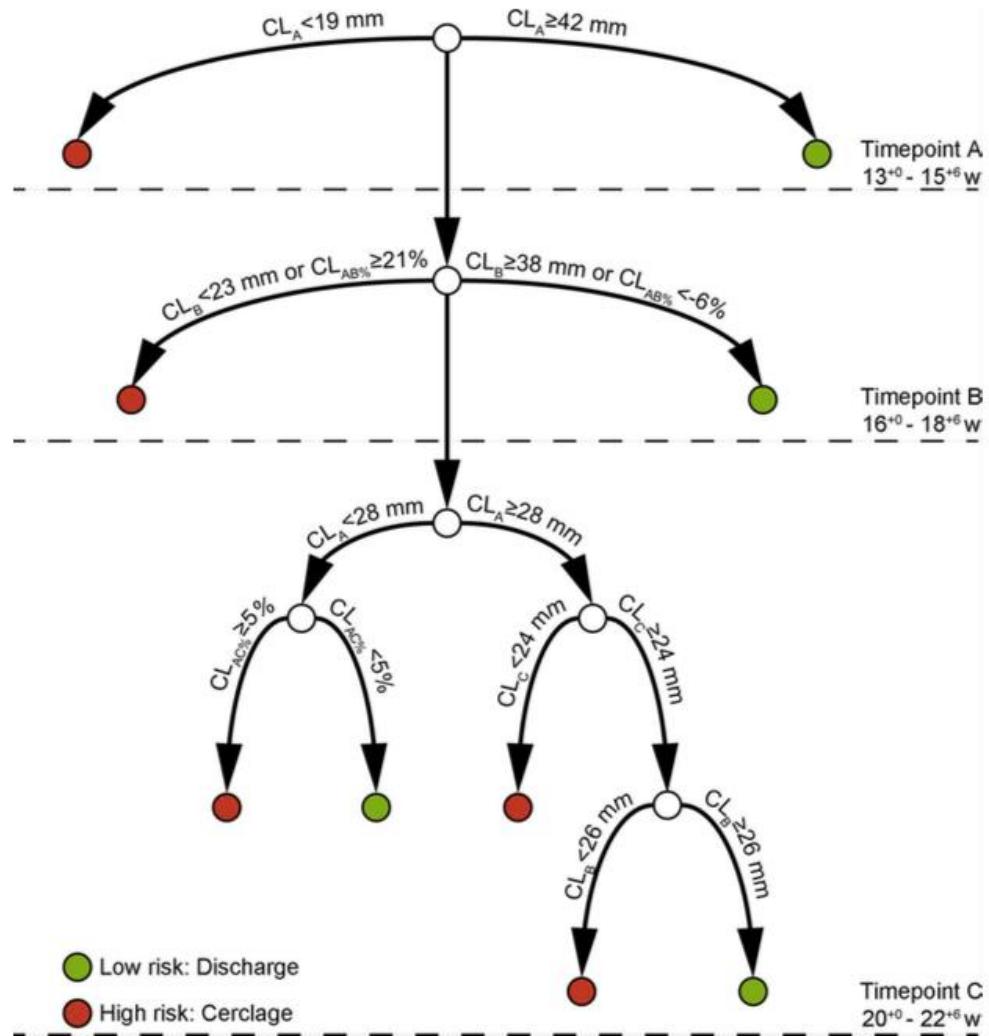

# Cervical assessment

---

- sequential scans/critical length?
  - low risk population, serial scans, change 24-28wks
  - ‘among women with a short cervix [<25mm], for every 1 mm of cervical shortening between ultrasounds, there was a 3% increase in the odds of SPTB....[with] stable or increased CL, rate of SPTB was lower than for women with decreased CL between visits...no association for women with a CL >25 mm’

# Cervical assessment

- sequential scans/LLETZ?

# Cervical assessment

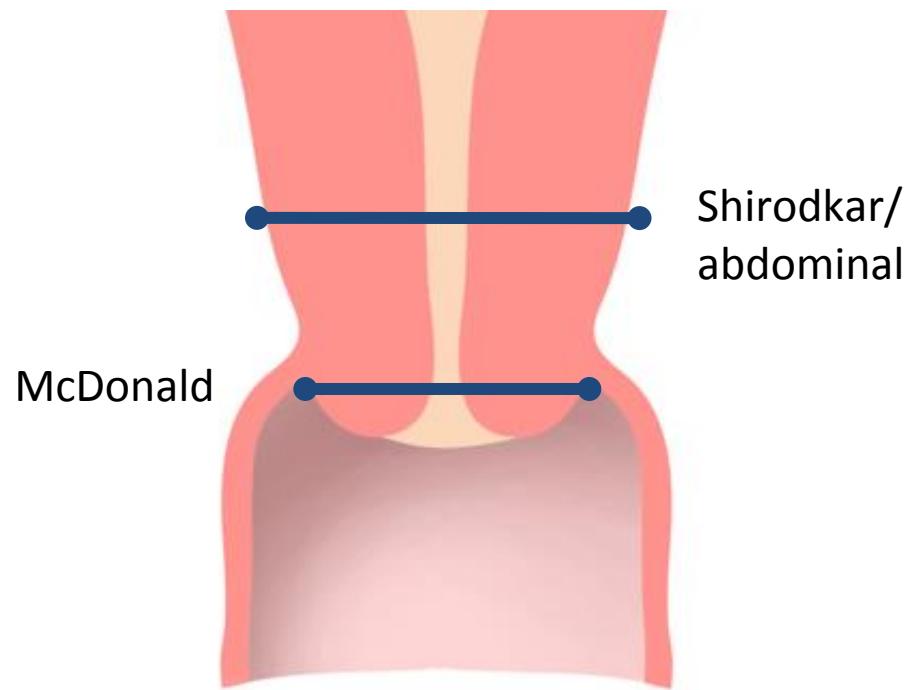

---

- start at 16 weeks for baseline measurement
- repeat scans according to POH
- assess internal os
- earlier collapse probably implies structural weakness

# Cerclage

---

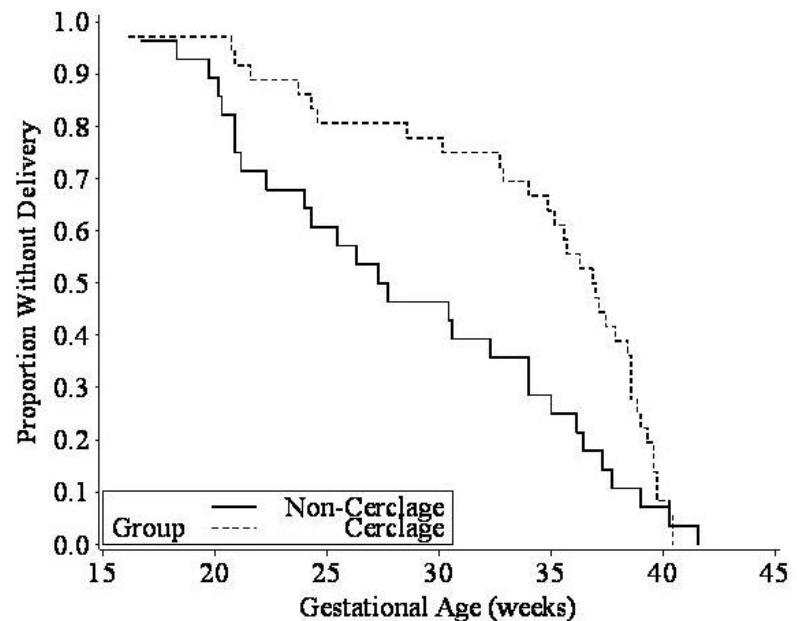

- types
  - McDonald
  - Shirodkar
  - transabdominal
- timing
  - elective
  - ultrasound-indicated
  - rescue

# Cerclage

---

- cerclage reduces sPTB by 30% in women with a history of sPTB and a cervix <25mm before 24 weeks gestation

Berghella V et al *Obstet Gynecol* 2011;117:663 (2011)  
Owen J et al *Am J Obstet Gynecol* 2009; 201:375 (2009)

# Pessaries

---

- Arabin
  - silicone
  - easier insertion
  - ongoing trials v cerclage and progesterone

# Cervical length

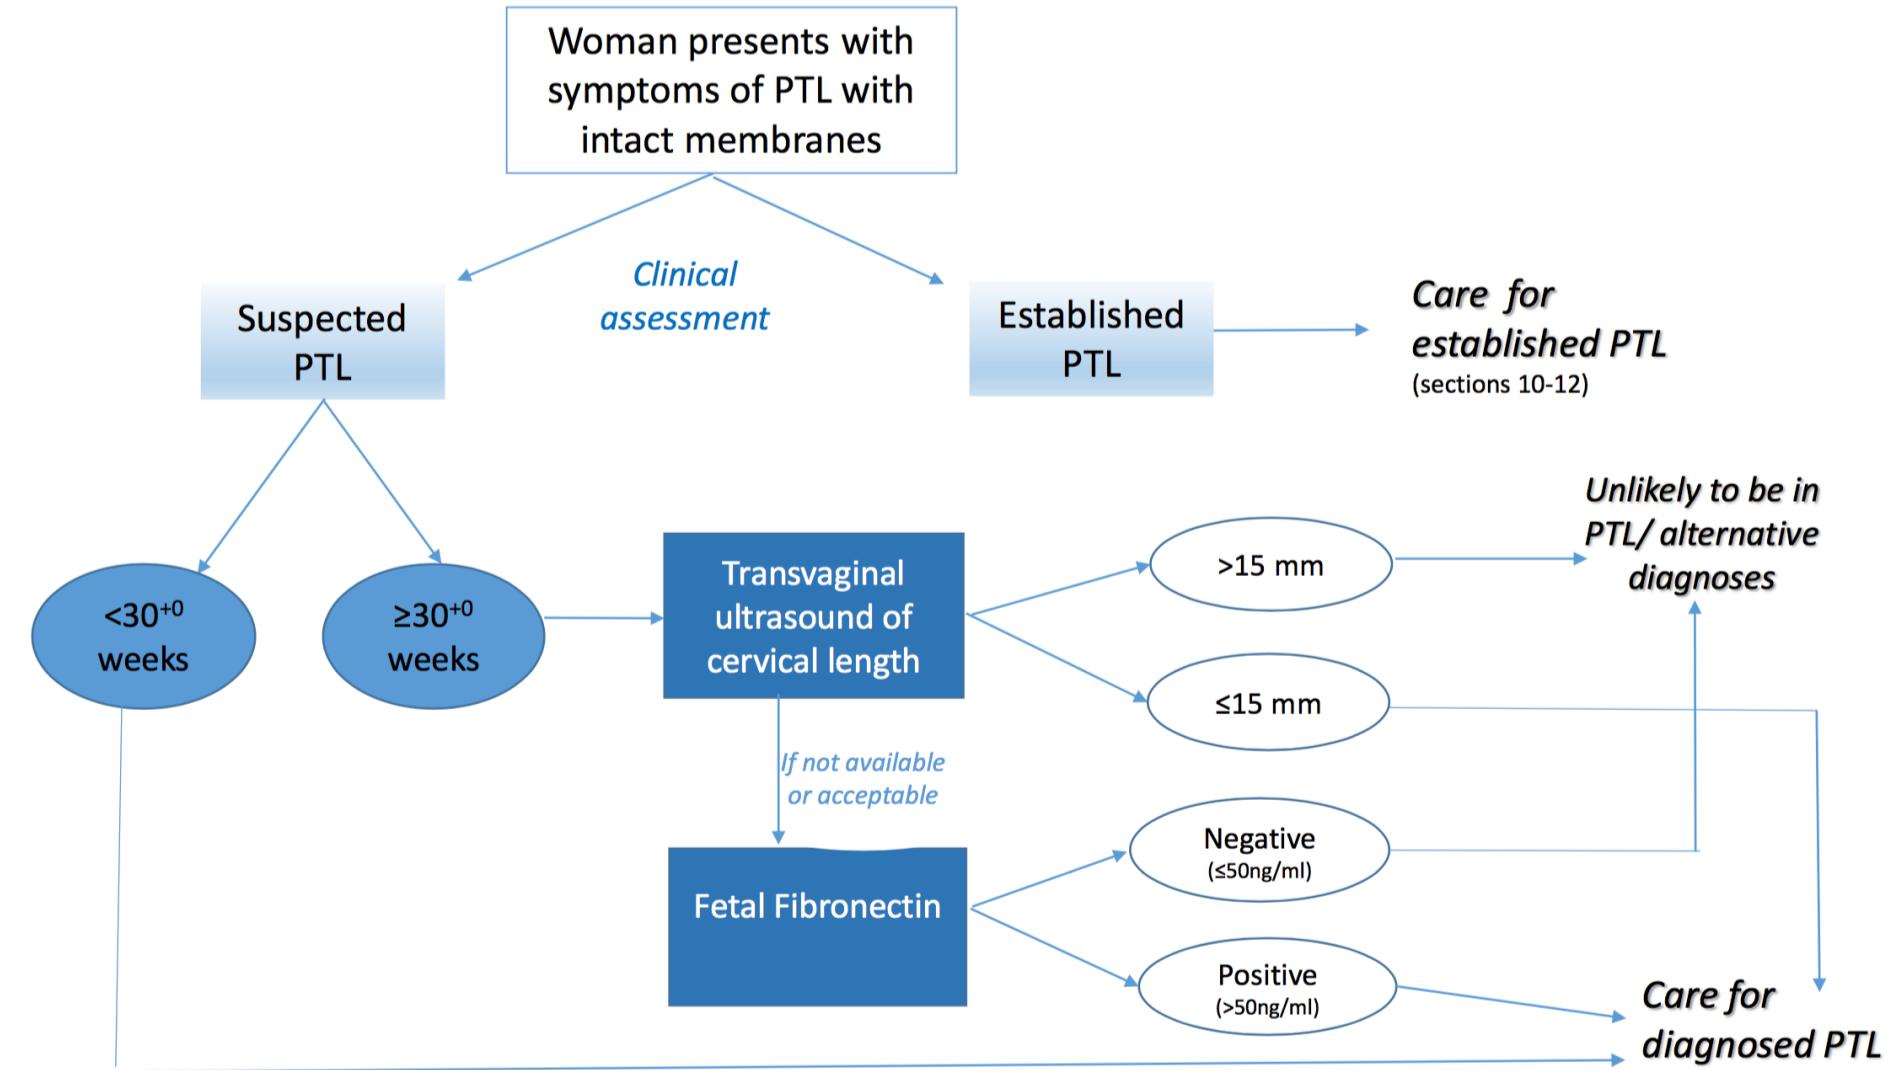

---

- indications
  - asymptomatic: to assess need for preventive strategies (progesterone, cerclage, pessary)
  - symptomatic: guide intervention (tocolysis, steroids, magnesium sulphate)

# Cervical length

---

- ‘If the clinical assessment suggests that the woman is in suspected preterm labour and she is 30+0 weeks pregnant or more, consider transvaginal ultrasound measurement of cervical length as a diagnostic test to determine likelihood of birth within 48 hours’

# Summary

---

- TVS assessment of cervix is here to stay
- use in symptomatic and high-risk asymptomatic women
- current challenges
  - adjunctive tests
  - management strategies
  - training
